PROFESSIONAL SUMMARY

Systems Administrator specializing in configuring reliable Linux environments, automating server administration tasks, and managing secure network architectures. Skilled in writing Bash scripts to handle routine operations, managing packages across Ubuntu and CentOS systems, and using Ansible to maintain configuration consistency. Experienced in monitoring system performance, analyzing log files to isolate root causes, and resolving production service outages quickly. Focused on keeping critical systems stable, secure, and running smoothly.

TECHNICAL SKILLS

- **Operating Systems:** Linux (Ubuntu, CentOS, Amazon Linux), Windows Server
- **Configuration Management:** Ansible
- **Scripting & Automation:** Bash, Python
- **Networking & Web Servers:** Nginx, Apache, DNS, DHCP, SSH ProxyJump, HTTP/HTTPS, VPC Routing, Security Groups
- **Monitoring & Log Analysis:** journalctl, top, htop, systemd, CloudWatch Logs, Apache Logs, MySQL Logs
- **Security & Access Control:** Public Key Infrastructure (PKI), SSH Key Management, IAM, Least Privilege Access, IMDSv2
- **Databases:** MySQL, PostgreSQL, MongoDB

SYSTEMS ADMINISTRATION PROJECTS

Secure AWS Server Architecture & Ansible Automation

- Built a hardened two-tier infrastructure layout, isolating backend application servers from the public internet by placing them in private subnets.
- Automated server software installations and security patching across instances using custom Ansible playbooks to ensure full environment consistency.
- Formulated secure administrative entry points by setting up a Bastion Host gateway using SSH ProxyJump configurations.
- Integrated system health checks and an Application Load Balancer to route traffic around server failures and prevent application downtime.

Production-Grade Infrastructure Provisioning

- Converted manual server setup processes into documented, version-controlled scripts to reduce deployment setup times from hours to under 30 minutes.
- Mapped out isolated local networks with distinct public and private subnets, managing network address translation (NAT) and route tables.

- Enforced modern security guidelines across running servers by activating IMDSv2 instance protection and configuring strict firewall rules via Security Groups.

SYSTEM DIAGNOSTICS & INCIDENT RESPONSE

- **Live Server Resource Recovery:** Resolved a critical production server crash caused by database resource exhaustion and high storage disk usage. Diagnosed the root cause by examining Apache logs and system metrics, resized the underlying host machine, and optimized the database engine configuration to restore full availability.
- **Linux Network Troubleshooting:** Fixed broken operating system network interfaces caused by faulty background package upgrades. Leveraged journalctl and system logs to track down kernel network conflicts, and repaired broken remote processes using SSH and Linux process management tools.

PROFESSIONAL EXPERIENCE

Systems & Web Platform Engineer (Freelance)
Self-Employed | August 2025 to January 2026

- Managed operational uptime and security policies for commercial web platforms hosted across public cloud and virtual private server environments.
- Deployed SSL/TLS certificates and hardened platform network configurations to protect financial transaction pathways and user databases.
- Monitored network traffic and adjusted web server configurations to handle high user volume without performance degradation.
- Handled daily backup procedures, domain name service (DNS) configuration updates, and storage volume optimization for client assets.

EDUCATION & CERTIFICATIONS

- **Diploma in Cloud Engineering** | AltSchool Africa, 2026
- **IT Infrastructure & DevOps Certification** | Bincom Academy, 2026
- **Front-End Software Engineering Virtual Experience** | Skyscanner Forage, 2026
